

Brandon Phillips Field

5425 Winton Ridge Lane, Cincinnati OH 45232

A drainage pipe was installed
sometime in 2012. See #5
below for details

1. The field maintenance manager indicates that the infield and left field dry very well. These areas are even playable in the late afternoon after a heavy morning rain. The area circled on the photo can take 1 and maybe 2 days to dry after a heavy rain.
2. The right field area circled in yellow does not drain well and they often have to rope off a section of this area.
3. The Reds would like to have the right field playable when the rest of the field is playable.
4. The washout occurring where the centerfield and leftfield fence intersect is NOT a problem that the Reds are concerned about. We should not design for this issue.
5. The drain pipe is not drainage for the field itself but rather to keep the water coming downhill from the north from entering the field. So the water enters a manhole to the north of the field and takes it south end of the field to the south.
